Choosing the Right Collaboration Solution for Healthcare Operations

A Buyer's Checklist

Healthcare professionals continually seek new ways to provide better care and increase patient satisfaction. The right digital collaboration solution can help.

The information below highlights the key features of the Intel Unite® solution. Use it to compare the healthcare collaboration products you're considering to the Intel Unite solution to help make your purchasing decision easier.

1 Easy to use

Users will appreciate how simple the Intel Unite solution is to use. After downloading the software to their device, they simply launch the Intel Unite app, then enter the six-digit on-screen PIN to join a meeting. Using the Ultrasonic Join feature makes connecting even faster: Clinicians can go from room to room to see patients and connect to each room's display in seconds simply by opening and closing their device.

In addition, the Intel Unite solution works with the familiar devices and operating systems your healthcare team already relies on, including Windows PCs, Macs, Chromebooks, iPads, Android tablets, and Linux-based devices. Whether they're in-person or remote, and no matter what device or OS they use, all participants enjoy the same viewing experience. With the Intel Unite solution, care teams can spend less time learning how to manage new technology and more time caring for patients.

2 Simple to deploy without additional configuration

The Intel Unite solution is designed to work with the way you work, instead of forcing you to work around it. It's based on standard IT building blocks and protocols for frictionless deployment and easier management. Deployment can follow your existing IT rules using the infrastructure, devices, and operating systems already in the environment. This minimizes the need for additional investments while increasing the effectiveness of your existing tools.

3 Easy to manage

Managing the Intel Unite solution is easy via a single-point management web portal. Remote administration capability enables management from any location, whether your IT team is on-site or off. In most cases, there's no need to change your existing processes, customize any software, or purchase additional hardware.

4 Easy to secure

The Intel Unite solution is designed to provide the security that clinicians and facilities need. Built-in, end-to-end encryption helps to enhance your existing security measures. Data never leaves the local network, and all communications occur between devices that are already allowed on the network and have been secured.

5 Reduces user support calls and IT workload

Thanks to an intuitive user interface with simple, consistent instructions across devices and operating systems, most users require no training to get started with the Intel Unite solution. Once the software is downloaded on a user's device, onboarding new users typically takes less than a minute. The solution's ease of use means fewer user support calls, reducing your IT team's workload.
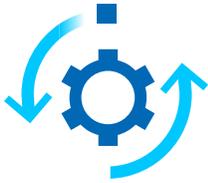

6 Easy to share a wide variety of content

Physicians and caregivers can quickly and wirelessly share any content on their device to in-room displays or other devices, regardless of operating system or device. Users can share X-rays and other images or HD video, EHR data, lab results, patient history and charts, follow-up treatment, and treatment strategies, helping patients better understand their medical information and treatment plans. This can boost patients' engagement with and collaboration of their care, which helps to increase patient satisfaction scores. When used with compatible hardware, the Intel Unite solution supports 4K, allowing users to share high-resolution content such as HD video.

Enhances collaboration and coordination of care

Providing quality healthcare often requires collaboration among physicians, clinicians, and other experts outside a facility. The Intel Unite solution makes it easy for multiple care team members—whether onsite or remote—to collaborate on treatment plans and consult with a patient simultaneously, enhancing coordination of care. Up to four presenters and three displays can present simultaneously, enabling up to 12 presenters at once to share information. Whether in-person or remote, and no matter what device or OS they use, all users will enjoy the same viewing experience.
